Sports Related Concussion

Richard Kim M.D., CAQSM
Primary Care Sports Medicine
18 year old male was playing ultimate frisbee. While attempting to catch a pass, lays out, hits the side of his head on the grass. Gets up immediately to play. Finished the game but developed a slight headache towards the end of the game. No prior head injuries. Develops slight irritability and trouble focusing for midterm exams next several days.
RESPONSE

- How many people think he had a concussion?
- How many would send to the ER?
- How many would want a CT Scan?
- How many would schedule a follow up?
- What would be your next steps?
OUTLINE

1. Process and Definitions
2. Evaluation
3. Management
4. Modifying Factors
5. Special Populations
6. Other Issues
7. SCAT3
1. PROCESS

- 4th meeting in Zurich 2012

- NIH consensus development conference format
  - Pre-defined group of questions
  - Body of literature identified
  - Presentation by experts in open session day 1 and day 2
  - Discussion / debate closed session with consensus panel on day 3
  - Document drafted by authors and circulated to panel
  - Knowledge translation
1. What is the lowest threshold to make a diagnosis of concussion?
2. Are the existing tools/exam sensitive and reliable enough on the day of injury to make or exclude a diagnosis of concussion?
3. What is the best practice for evaluating an adult athlete on the "field of play" in 2012? 2015?
4. How can the SCAT2 be improved?: evidence for utility of components
5. What evidence exists for new strategies/technologies in the diagnosis of concussion and assessment of recovery?
6. Advances in the management of sport concussion: what is evidence for concussion therapies?

7. The difficult concussion patient - What is the best approach to investigation and management of persistent (>10 days) post concussive symptoms?

8. Revisiting Modifiers: how should the evaluation and management of acute concussion differ in specific groups?

9. What are the most effective risk reduction strategies in sport concussion?: from protective equipment to policy

10. What is the evidence for chronic concussion-related changes?; behavioral, pathological and clinical outcomes

11. From Consensus to Action- How do we optimize Knowledge transfer, education and ability to influence policy?

Glasgow Coma Scale

Severe  GCS ≤ 8
Moderate  GCS 9 - 12
Mild  GCS 13 - 15

Sports concussion

Teasdale et al Lancet 1974; ii: 81-4
DEFINITION: SPORTS CONCUSSION

“Concussion is a brain injury and is defined as a complex pathophysiological process affecting the brain, induced by biomechanical forces. Several common features that incorporate clinical, pathologic and biomechanical injury constructs that may be utilized in defining the nature of a concussive head injury include…”
DEFINITION

1. Concussion may be caused either by a direct blow to the head, face, neck or elsewhere on the body with an ‘impulsive’ force transmitted to the head.

2. Concussion typically results in the rapid onset of short-lived impairment of neurologic function that resolves spontaneously. However, in some cases symptoms and signs may evolve over a number of minutes to hours.

3. Concussion may result in neuropathological changes but the acute clinical symptoms largely reflect a functional disturbance rather than a structural injury and as such, no abnormality is seen on standard structural neuroimaging studies.

4. Concussion results in a graded set of clinical symptoms that may or may not involve loss of consciousness. Resolution of the clinical and cognitive symptoms typically follows a sequential course. However, it is important to note that in some cases, post-concussive symptoms may be prolonged.
3. EVALUATION
SIGNS AND SYMPTOMS

- Symptoms - somatic (e.g. headache), cognitive (e.g. feeling like in a fog) and/or emotional symptoms (e.g. lability)
- Physical signs (e.g. loss of consciousness, amnesia)
- Behavioural changes (e.g. irritability)
- Cognitive impairment (e.g. slowed reaction times)
- Sleep disturbance (e.g. drowsiness, insomnia)
ON-FIELD EVALUATION OF CONCUSSION

▶ The player should be evaluated by a physician or other licensed healthcare provider onsite using standard emergency management principles and particular attention should be given to excluding a cervical spine injury.

▶ The appropriate disposition of the player must be determined by the treating healthcare provider in a timely manner. If no healthcare provider is available the player should be safely removed from practice or play and urgent referral to a physician arranged.

▶ Once the first aid issues are addressed an assessment of the concussive injury should be made using the SCAT3 or other sideline assessment tools.

▶ The player should not be left alone following the injury and serial monitoring for deterioration is essential over the initial few hours following injury.

▶ A player with diagnosed concussion should not be allowed to return to play on the day of injury.
NOTE: Developed by SCAT3 Subcommittee (Meeuwisse, McCrory, Dvorak, Echemendia, Guskiewicz, Iverson, Johnston, McCrea, Putukian, Raftery, Schneider)

EVALUATION IN EMERGENCY ROOM OR OFFICE BY MEDICAL PERSONNEL

- Individual clinical decision
- A medical assessment including a comprehensive history and detailed neurological examination including a thorough assessment of mental status, cognitive functioning and gait and balance.
- A determination of the clinical status of the patient including whether there has been improvement or deterioration since the time of injury. This may involve seeking additional information from parents, coaches, teammates and eyewitness to the injury.
- A determination of the need for emergent neuroimaging in order to exclude a more severe brain injury involving a structural abnormality.

In large part, these points above are included in the SCAT3 assessment.
EXAM

- Cranial nerves
- Cerebellar exam
  - Rhomberg, Pronator drift, Finger-to-nose
- Strength exam
  - Upper and Lower
- Deep tendon reflex exam
  - Upper and Lower
- Balance exam
- Fundoscopic exam
Investigations

- Neuroimaging (CT, MRI)
  - Contributes little to concussion evaluation
  - Use when suspicion of cerebral or structural lesion exists:
    - focal neurologic deficit
    - worsening symptoms
    - Prolonged disturbance of conscious state

- Other modalities such as fMRI correlate with symptom severity and recovery and although not routinely used presently may provide additional insight.

- Alternative imaging technologies are still at early stage of development in concussion and not recommended other than research setting.
INVESTIGATIONS

- Postural stability testing-deficits 72hr post concussion
  - Balance error scoring system (BESS), force plate technology

- Genetic testing/markers
  - Significance unclear for Apolipoprotein (Apo) E4, ApoE promoter gene, Tau polymerase, other genetic and cytokine factors
  - Insufficient evidence for routine clinical use
Neuropsychological (NP) assessment:

- Important component in overall assessment and RTP
- Should NOT be sole basis of management decisions, but an aid to clinical decision making
- Included as part of clinical neurological assessment by treating physician often with computerized NP screening tools
- Formal NP testing not required for all but, if so, interpretation should be performed by trained neuropsychologist.
- Best done when asymptomatic but may be advantageous at other stages in particular situations
- Baseline testing not mandatory. May be helpful in test interpretation and for education opportunity
4. MANAGEMENT
RECOVERY

- Majority (80-90%) resolve in short (7-10 day) period
- May take longer in children and adolescents
MANAGEMENT

• CORNERSTONE = initial period of rest until acute symptoms resolve

  • Physical Rest
    • No training, playing, exercise, weights
    • Beware of exertion with activities of daily living
  
  • Cognitive Rest
    • No television, extensive reading, video games?
    • Caution re: daytime sleep
MANAGEMENT

▷ Expect gradual resolution within 7-10 days
▷ Gradual return to school and social activities that does not result in significant exacerbation of symptoms
▷ Proceed through step-wise return to sport / play (RTP) strategy
Everyone “feels fine”

Always ask:
1. “On a scale of 0 to 100%, how do you feel?”
2. “what makes you not 100%?”
3. Symptom Checklist - SCAT3
### GRADUATED RTP PROTOCOL

<table>
<thead>
<tr>
<th>Rehabilitation stage</th>
<th>Functional exercise at each stage of rehabilitation</th>
<th>Objective of each stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. No activity</td>
<td>Symptom limited physical and cognitive rest.</td>
<td>Recovery</td>
</tr>
<tr>
<td>2. Light aerobic exercise</td>
<td>Walking, swimming or stationary cycling keeping intensity ≤ 70% MPHR. No resistance training.</td>
<td>Increase HR</td>
</tr>
<tr>
<td>3. Sport-specific exercise</td>
<td>Skating drills in ice hockey, running drills in soccer. No head impact activities.</td>
<td>Add movement</td>
</tr>
<tr>
<td>4. Non-contact training drills</td>
<td>Progression to more complex training drills e.g. passing drills in football and ice hockey. May start progressive resistance training</td>
<td>Exercise, coordination, and cognitive load</td>
</tr>
<tr>
<td>5. Full contact practice</td>
<td>Following medical clearance participate in normal training activities.</td>
<td>Restore confidence and assess functional skills by coaching staff</td>
</tr>
<tr>
<td>6. Return to play</td>
<td>Normal game play</td>
<td></td>
</tr>
</tbody>
</table>

- 24 hours per step (therefore about 1 week for full protocol)
- If recurrence of symptoms at any stage, return to previous asymptomatic level and resume after further 24 hr period of rest
SAME DAY RETURN TO PLAY?

△ NO!

△ Unanimously agreed that no RTP should occur on the day of concussive injury
RETURN TO PLAY / SPORT

▶ Must pass graded exertion first
  = remain asymptomatic
▶ Is the athlete confident to go back?
▶ New helmet/head gear?
▶ Other “protective” equipment / behaviors / factors?
▶ Consider implications of multiple/recent injury
“DIFFICULT” OR PERSISTENTLY SYMPTOMATIC CONCUSSION PATIENT

- Persistent symptoms (>10 days) in about 10-15%
- Important to consider other issues
- Should be managed in multidisciplinary manner by healthcare providers experienced in sport concussion
  - In order to consider sub-symptom threshold exercise and other forms of therapy/rehabilitation
• Psychological approaches may have application especially in selected situations (modifiers)
• Evaluate for affective symptoms (depression, anxiety) as common in all forms of traumatic brain injury
• Depression—may be consequence of concussion, underlying pathophysiological abnormality, may be multifactorial but should be considered in management
MANAGEMENT

- Pharmacotherapy
  - Prolonged symptoms (sleep disturbance, anxiety)
  - Modify underlying pathophysiology
- Upon return to play should not be on medication that could mask symptoms
  - Antidepressants?
5. MODIFYING FACTORS
<table>
<thead>
<tr>
<th>FACTORS</th>
<th>MODIFIER</th>

</tr>
<tr>
<td>Sequelae</td>
<td>Concussive convulsions</td>
</tr>
<tr>
<td>Temporal</td>
<td>Frequency - repeated concussion over time Timing - injuries close together “Recency” - recent concussion or TBI</td>
</tr>
<tr>
<td>Threshold</td>
<td>Repeated concussions occurring with progressively less impact force or slower recovery after each successive concussion</td>
</tr>
<tr>
<td>Age</td>
<td>Child and adolescent (&lt; 18 years old)</td>
</tr>
<tr>
<td>Co and Pre-morbidities</td>
<td>Migraine, depression or other mental health disorders, attention deficit hyperactivity disorder (ADHD), learning disabilities (LD), sleep disorders</td>
</tr>
<tr>
<td>Medication</td>
<td>Psychoactive drugs Anticoagulants</td>
</tr>
<tr>
<td>Behaviour</td>
<td>Dangerous style of play</td>
</tr>
<tr>
<td>Sport</td>
<td>High risk activity Contact and collision sport High sporting level</td>
</tr>
</tbody>
</table>
MODIFIERS

▷ May influence investigation and management
▷ May predict potential for prolonged or persistent symptoms
▷ Multidisciplinary approach coordinated by a physician with specific expertise in management of concussion.
6. SPECIAL POPULATIONS
CHILD AND ADOLESCENT ATHLETE

- Adult recommendations can apply down to age 13
- Below 13 require age appropriate symptom checklists and evaluation tool
  - child SCAT3 developed for this purpose
- Include both patient and parent, teacher, school input.
- Possibly use neuropsychological testing before symptoms resolve to help plan school management
  - must be developmentally sensitive, consider use of trained pediatric neuropsychologist

NOTE: Pediatric subcommittee has developed age-specific Child SCAT3 (Davis, McCrea, G. Gioia, Purcell, Ellenbogen, C. Vaughan, Guskiewicz, Kutcher, Meeuwisse, McCrory)
CHILD AND ADOLESCENT ATHLETE

- Consider age specific physical and cognitive rest issues
  - school attendance and activities need to be modified
- No return to sport or activity until returned to school successfully
- Symptom resolution may take longer, modifiers apply even more
- More conservative RTP approach recommended:
  - Consider extending symptom-free period before starting return to play protocol
  - Consider extending length of the graded exertion protocol
- Never return to play same day
ELITE VS NON-ELITE

- All athletes should be managed the same regardless of level of participation
- Available resources and expertise may determine management approaches
- Consider cognitive evaluation in all organized high-risk sports regardless of age or level of performance
7. OTHER ISSUES
CHRONIC TRAUMATIC ENCEPHALOPATHY (CTE)

- Acknowledge potential for long-term problems in all athletes
- CTE unknown incidence in athletic populations, cause/effect not yet demonstrated between CTE and concussions or exposure to contact sport
PREVENTION

- Protective equipment
  - Mouthguards have benefit in prevention oral injury, but no evidence of concussion reduction
  - Head gear and helmets show reduction in biomechanical forces, but have not translated to a reduction in concussion incidence
  - Helmets reduce head and facial injury in skiing and snowboarding and are recommended for alpine sports
  - Helmets reduce other forms of head injury (e.g. fracture) in cycling, equestrian, motor sports
PREPARTICIPATION EVALUATION

History:
- Type of sport?
- Previous symptoms of concussions?/length of recovery (recall unreliable from teammates, coaches)
- Prior head, maxillofacial, spine injuries?
- Non-sporting head injuries?
- Type of player (“physical”?)
- Ability to “take a hit”
- Protective equipment (helmet age)

Opportunity to Educate!
KNOWLEDGE TRANSFER

▶ Education of athletes, parents, coaches
▶ Awareness of concussion symptoms and signs
▶ Fair play and respect
▶ Role for web based resources, social media
SUMMARY: WHAT’S NEW?

▷ Evaluation on the “field of play”
▷ Postural stability assessment
▷ Timing of “rehabilitation”
▷ The difficult concussion patient
▷ Special populations
▷ New Tools
  ▷ Sport Concussion Assessment Tool revision (SCAT3)
  ▷ Child SCAT3
  ▷ Concussion Recognition Tool (CRT) for lay use
SCENARIO 1 - CHALLENGE

- 18 year-old female rugby player who plays fly-half position. She went down at the end of a game. No clear memorable hit. MD called over to evaluate after whistle blew. She said “I just feel dizzy and nauseous.” Suffered a concussion earlier in the summer.
- Exam showed she had unsteadiness on her feet. Photophobia.
- SCAT3 was done.
RESPONSE

▷ How many people think she had a concussion?
▷ How many would send to the ER?
▷ How many would want a CT Scan?
▷ How many would schedule a follow up?
▷ What would be your next steps?
SCENARIO 2 - DISASTER

- 20 year old male playing intramural football. Collided with another player. He does not recall any of the events. His friends told him that he was “out cold.” Friends said he was breathing funny. He came to and was taken to the sideline. Looked kind of blue. Had numbness, tingling. Had trouble holding his head up. Ambulance was called.
RESPONSE

- How many people think he had a concussion?
- How many would send to the ER?
- How many would want a CT Scan?
- How many would schedule a follow up?
- What would be your next steps?
PART 2 – IN OFFICE

- CT Scan of Head was negative for acute findings
- Neuro exam was nonfocal
- Balance was off
SPORT CONCUSSION ASSESSMENT TOOL
3RD EDITION

SCAT3
SIDELINE ASSESSMENT

Indications for Emergency Management

NOTE: A hit to the head can sometimes be associated with a more serious brain injury. Any of the following warrants consideration of activating emergency procedures and urgent transportation to the nearest hospital:

- Glasgow Coma score less than 15
- Deteriorating mental status
- Potential spinal injury
- Progressive, worsening symptoms or new neurologic signs

Potential signs of concussion?

If any of the following signs are observed after a direct or indirect blow to the head, the athlete should stop participation, be evaluated by a medical professional and **should not be permitted to return to sport the same day** if a concussion is suspected.

Any loss of consciousness?  
“If so, how long?”  
Balance or motor incoordination (stumbles, slow/laboured movements, etc.)?  
Disorientation or confusion (inability to respond appropriately to questions)?  
Loss of memory:  
“If so, how long?”  
“Before or after the injury?”  
Blank or vacant look:  
Visible facial injury in combination with any of the above:
### Glasgow coma scale (GCS)

#### Best eye response (E)
- No eye opening: 1
- Eye opening in response to pain: 2
- Eye opening to speech: 3
- Eyes opening spontaneously: 4

#### Best verbal response (V)
- No verbal response: 1
- Incomprehensible sounds: 2
- Inappropriate words: 3
- Confused: 4
- Oriented: 5

#### Best motor response (M)
- No motor response: 1
- Extension to pain: 2
- Abnormal flexion to pain: 3
- Flexion/Withdrawal to pain: 4
- Localizes to pain: 5
- Obey commands: 6

**Glasgow Coma score (E + V + M)**

GCS should be recorded for all athletes in case of subsequent deterioration.
2

**Maddocks Score**

“*I am going to ask you a few questions, please listen carefully and give your best effort.*”

Modified Maddocks questions (1 point for each correct answer)

<table>
<thead>
<tr>
<th>Question</th>
<th>Score 0</th>
<th>Score 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>What venue are we at today?</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Which half is it now?</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Who scored last in this match?</td>
<td></td>
<td></td>
</tr>
<tr>
<td>What team did you play last week/game?</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Did your team win the last game?</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Maddocks score**

Maddocks score is validated for sideline diagnosis of concussion only and is not used for serial testing.
BACKGROUND

Name: ___________________________ Date: ___________________________
Examiner: ________________________
Sport/team/school: ____________________ Date/time of injury: ____________
Age: ____________________________ Gender: □ M □ F
Years of education completed: __________________________
Dominant hand: □ right □ left □ neither
How many concussions do you think you have had in the past? __________________________
When was the most recent concussion? __________________________
How long was your recovery from the most recent concussion? __________________________
Have you ever been hospitalized or had medical imaging done for a head injury? □ Y □ N
Have you ever been diagnosed with headaches or migraines? □ Y □ N
Do you have a learning disability, dyslexia, ADD/ADHD? □ Y □ N
Have you ever been diagnosed with depression, anxiety or other psychiatric disorder? □ Y □ N
Has anyone in your family ever been diagnosed with any of these problems? □ Y □ N
Are you on any medications? If yes, please list: __________________________
### How do you feel?
